

Adding a Hardwired ISP for Failover Can be Challenging

InSpeed Makes it Easy with 4g Modems

Now, you can get a cost-effective, easy to install backup link with a 4G modem. You know how important it is to ensure your WAN stays up and running, and having a failover line is key.

Two Easy Options:

Do it yourself:

If you're a hands on type of person, installing the 4G modem is a snap. Using any industry standard Ethernet connected modem and cellular account, configure a second WAN connection on your InSpeed premise system as a failover account and IQS will automatically utilize the new connection to provide full business connectivity for your site.

Managed service:

Let the experts at InSpeed take care of all the details. For a one time service fee and small monthly increase to your subscription InSpeed experts will source and manage the appropriate equipment and cellular service plans for your specific location.
