

Increase Security at Your Branch Offices While Improving Network Performance—Cost Effectively

It's never been more important to ensure your branch offices and remote locations have the same level of security as headquarters.

InSpeed Networks can help, with breakthrough technology that not only increases network performance but improves security at branch offices and remote locations easily and cost-effectively.

InSpeed's integrated, end-to-end security services include:

- An enterprise wide Virtual Private Network (VPN) to protect company data as it travels over the Internet
- Same level of security as a private site-to-site network mesh
- Added security of dedicated networks
- Standard “best practices” firewall security services included, to automatically protect your remote office's Internet connections from unwanted attacks

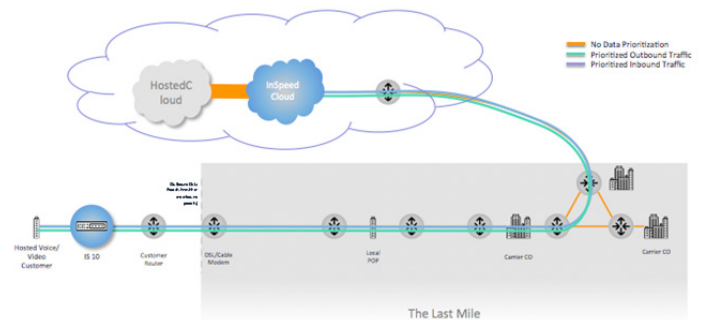

And, it works over commodity broadband connections and is easy to provision—with a single click.

How InSpeed Security Works

The InSpeed Network Appliance runs all enterprise* traffic through a full VPN end-to-end encrypted connection. This is automatically enabled without costly and complicated equipment or software.

The local Internet connection is protected from external attack with best practices firewall security mechanisms.

*Enterprise traffic: Internal company traffic, site-to-site traffic, etc

Ready for your remote offices to be as secure as headquarters?
